

Phase II Education Distribution

The education distribution in [Phase II](#) is fundamentally the same as [the distribution in federation](#). It is a merit-based, [backpack-funded](#) reimbursement to schools and teachers.

In Phase II, K-12 is typically funded by state, county, and local taxes. If funding for all schools in the [dominion](#) is approximately equal per student and not funded by the property tax, then the education distribution can be used to eliminate some of that taxation. However, one or both of those preconditions are often false.

A typical [Phase II dominion](#), population 107,800, will have a [monthly education distribution of \\$5.5 million](#).

The advent of VIP\$ [deflation](#) will tend to reallocate resources in education, so that those resources operate consistently with the education distribution. Such deflation is not expected to occur until the [ABC](#) enters Phase II. There are several options for the many communities that enter Phase II while the ABC and [VIP Treasury](#) are still in [Phase I](#).

There might be institutions of higher learning and trade schools somewhere in the world (such as privately run [viral communities](#) or earlier Phase II dominions) whose operations are consistent with the education distribution. These institutions will also have dormitories that accept the [food](#) and [housing distributions](#) as full payment. Student health insurance will work through a [self-insured HMO](#).

Other institutions are consistent with the education distribution but charge the students additional fees. This is acceptable provided the schools agree to the per-student-per-class remuneration of teachers directly, to per-student-per-class remuneration of the school, and to merit variation in pay based on regular student testing in tests prepared by [Voluntary Standards Groups](#) affiliated with the related trade or field of study, should they exist. Dormitories must be equipped to accept the food and housing distributions. However, they too are free to charge additional fees.

Students accepted at these institutions will have their distributions routed from the VIP Treasury, until such time as the Phase II dominion is a [level-5 dominion](#) and requests control of the entire education distribution. Until then, the Phase II education distribution, e.g., \$5.5 million/month, will be automatically debited by the Treasury for resident distributions to out-of-dominion schools.

As seen in [The Education Distribution](#), the monthly cost per student enrolled in 15 hours at a university, meeting AFFEERCE educational distribution requirements, is \$227. This is greater than the per capita monthly distribution of \$51, however, it is assumed the average person spends less than 25% of their life in higher education. This is higher than the [current average of 15%](#) for ALL grades and should be very safe prior to [federation](#) when the education distribution is increased.

Create an Institution

The \$5.5 billion/month (minus outside enrollments) could be used to build, treble, or purchase a large community college/university/trade school that is consistent with the education distribution. The best option is to build the school on private land and get a rebate on construction when the property is sold into the [commons trust](#).

Because it would be a public institution, there can be no additional fees. However, it can also charge the monthly universal copay from students in addition to the distribution, and profit from mixed-use dormitory/classrooms.

The school is administered as a [parallel cell](#) with a [jurisdictional covenant](#) restricting the land to be a public university. A [trebler](#) must maintain the university as an education distribution-consistent entity.
